EOVARIS · DESIGN 02 · 25 OCTOBER 2026

One app for Matthew’s day.

Evolve Eovaris with the strongest PlanPilot project controls, FieldScribe evidence workflows and Eovaris conversations. Preserve working connections where compatible. Keep the existing Hub Chief as the execution backend.

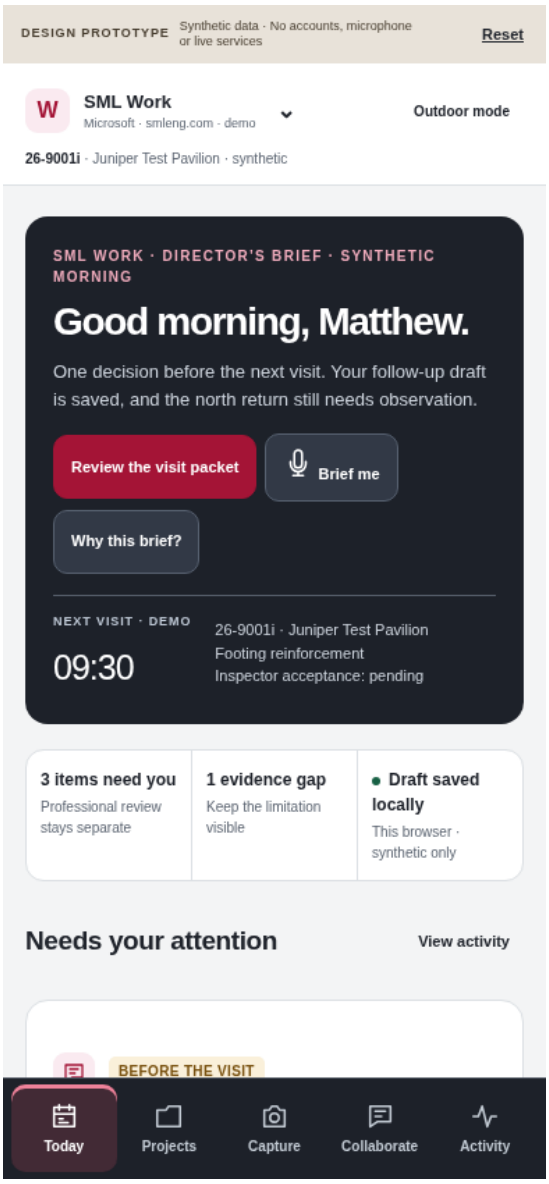

Today • Projects • Capture • Collaborate • Activity

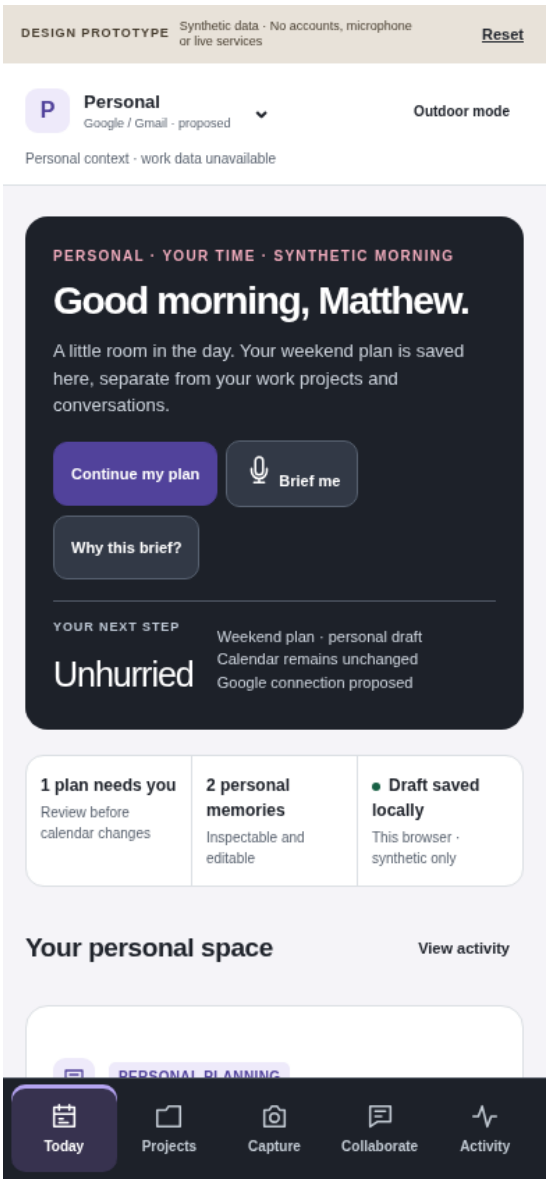

A professional graphite and crimson Work interface, distinct Personal context, durable task artifacts and source-linked decisions. This package contains synthetic browser design, not an implemented native app.

MATTHEW-FIRST NAVIGATION

Start with the next decision.

Work Today shows the next visit, items needing Matthew and a task ready to resume. Personal uses a separate identity label, accent, memory and plan. Context switching does not transfer work.

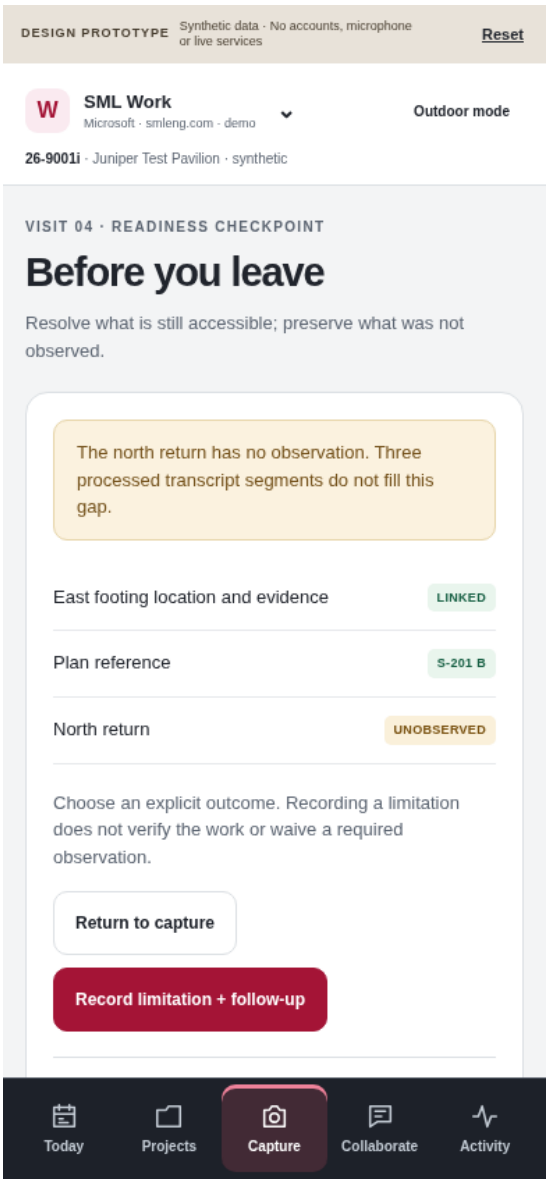

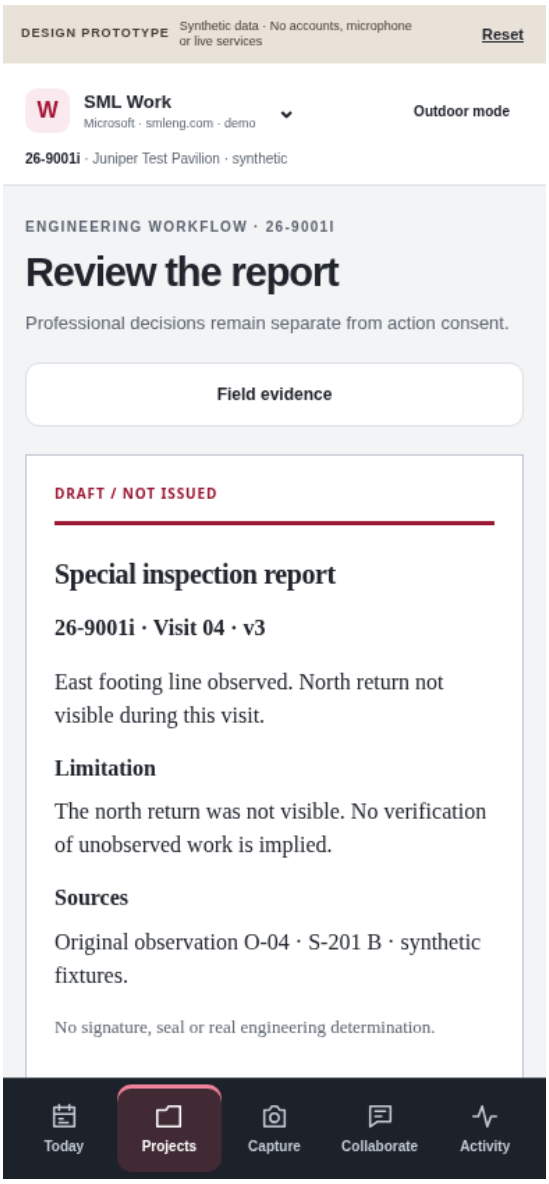

One queue, one project registry view and one report lifecycle. Collaborate contains Conversation, Tasks, Memory and Team; Agent Studio is a detail screen. No extra primary dashboards.

FIELD EVIDENCE AND PROFESSIONAL AUTHORITY

Catch the gap before leaving.

Capture once; link the original observation to the finding, open item and contractor request. Complete transcription does not establish complete inspection coverage.

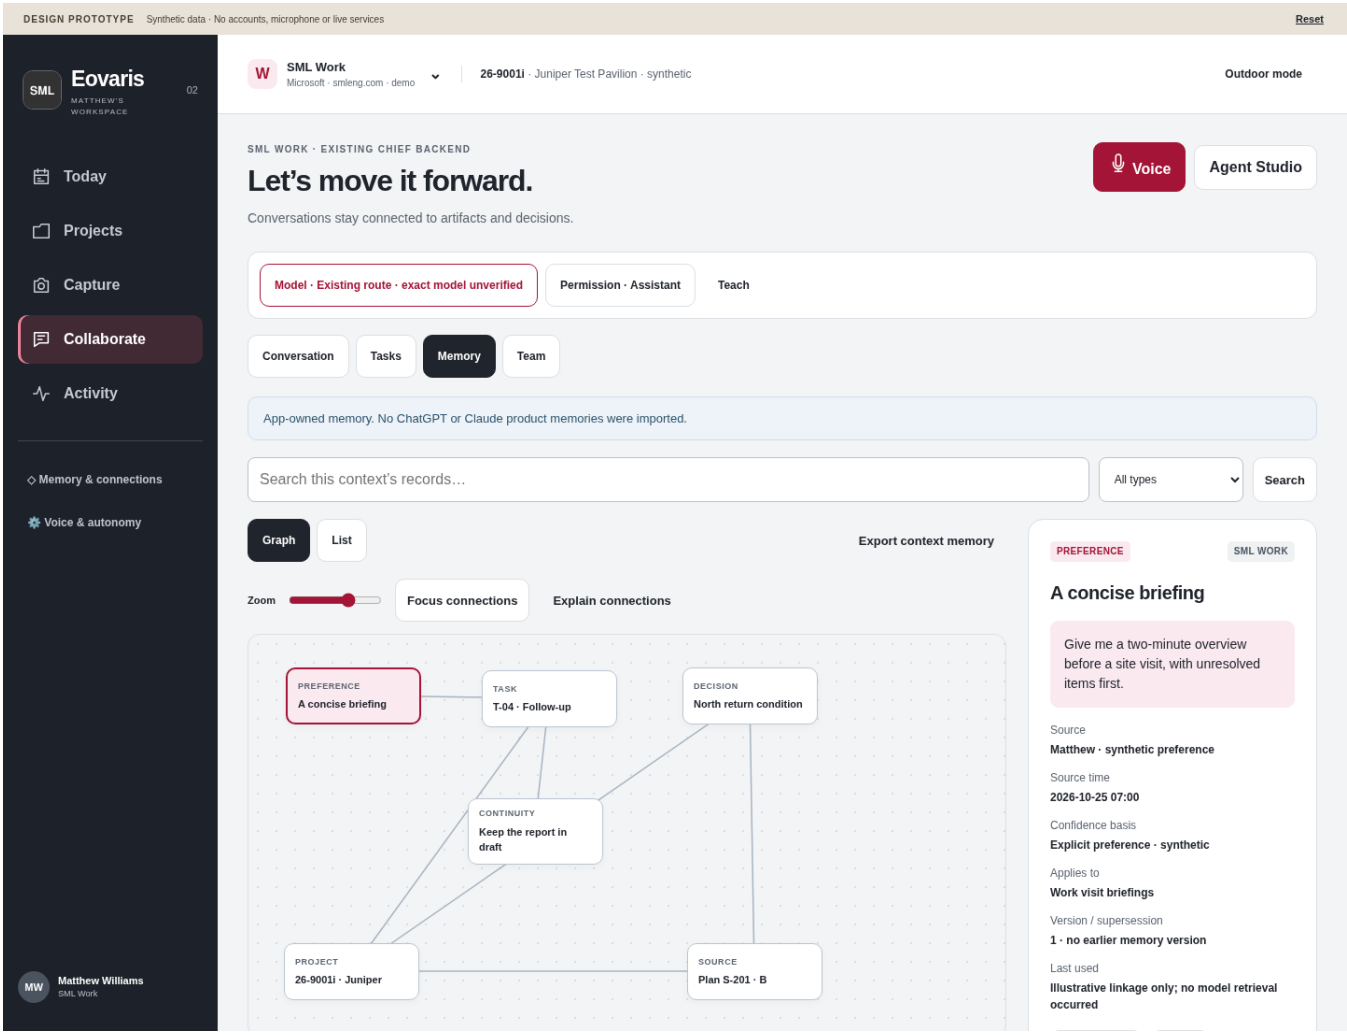

A limitation keeps unobserved work unresolved. The report remains a draft until its own professional workflow passes. Missing signer blocks issuance. Action consent cannot sign a report or accept an engineering determination.

PERSISTENT APP-OWNED MEMORY

See why the agent remembers.

The graph is a useful relationship view over authorized records, with list/search alternatives. Inspect source, timestamp, confidence basis, applicability and supersession; correct, forget or export the active context.

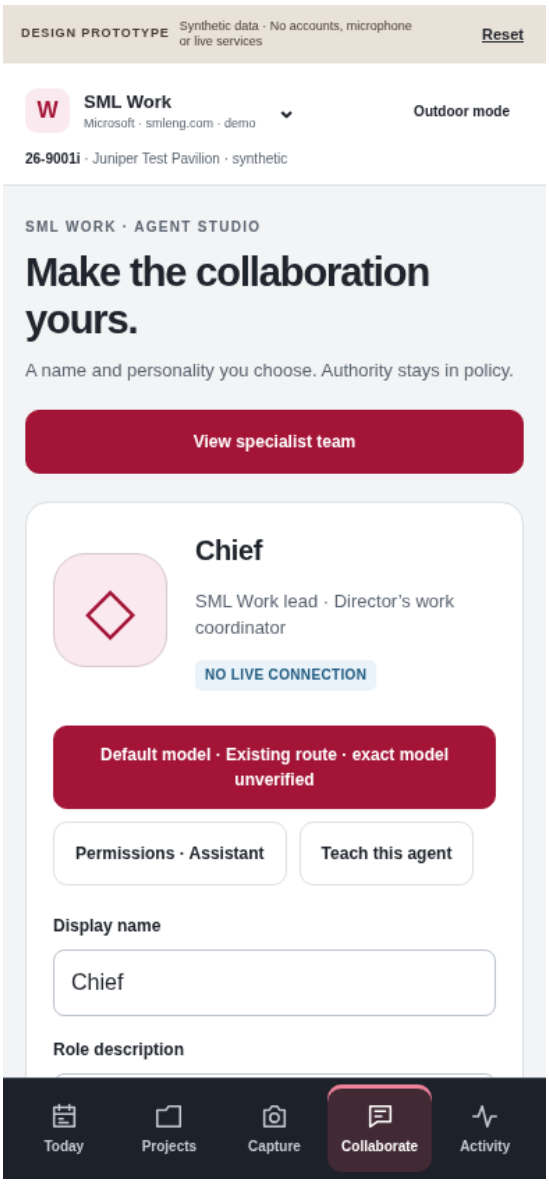

Work/Personal permissions must apply before retrieval, traversal, counts and serialization. Selected-item transfer needs an exact preview and policy check. No ChatGPT or Claude product memory was imported.

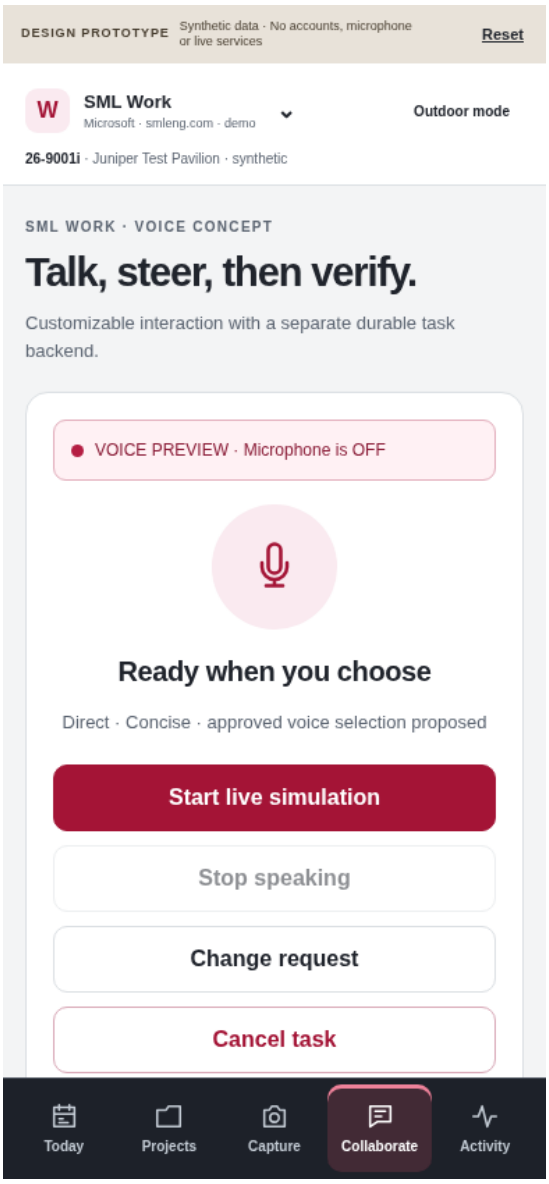

Prototype: selectable synthetic nodes, search, list, zoom, source inspector and local memory lifecycle. Server security, source sync and durable deletion remain implementation gates.

PERSONALIZATION AND LIVE COLLABORATION

Make it feel like your team.

Name each lead independently. Choose an abstract avatar, local image and communication style. A persona cannot expand credentials, memory scope, tools or professional authority.

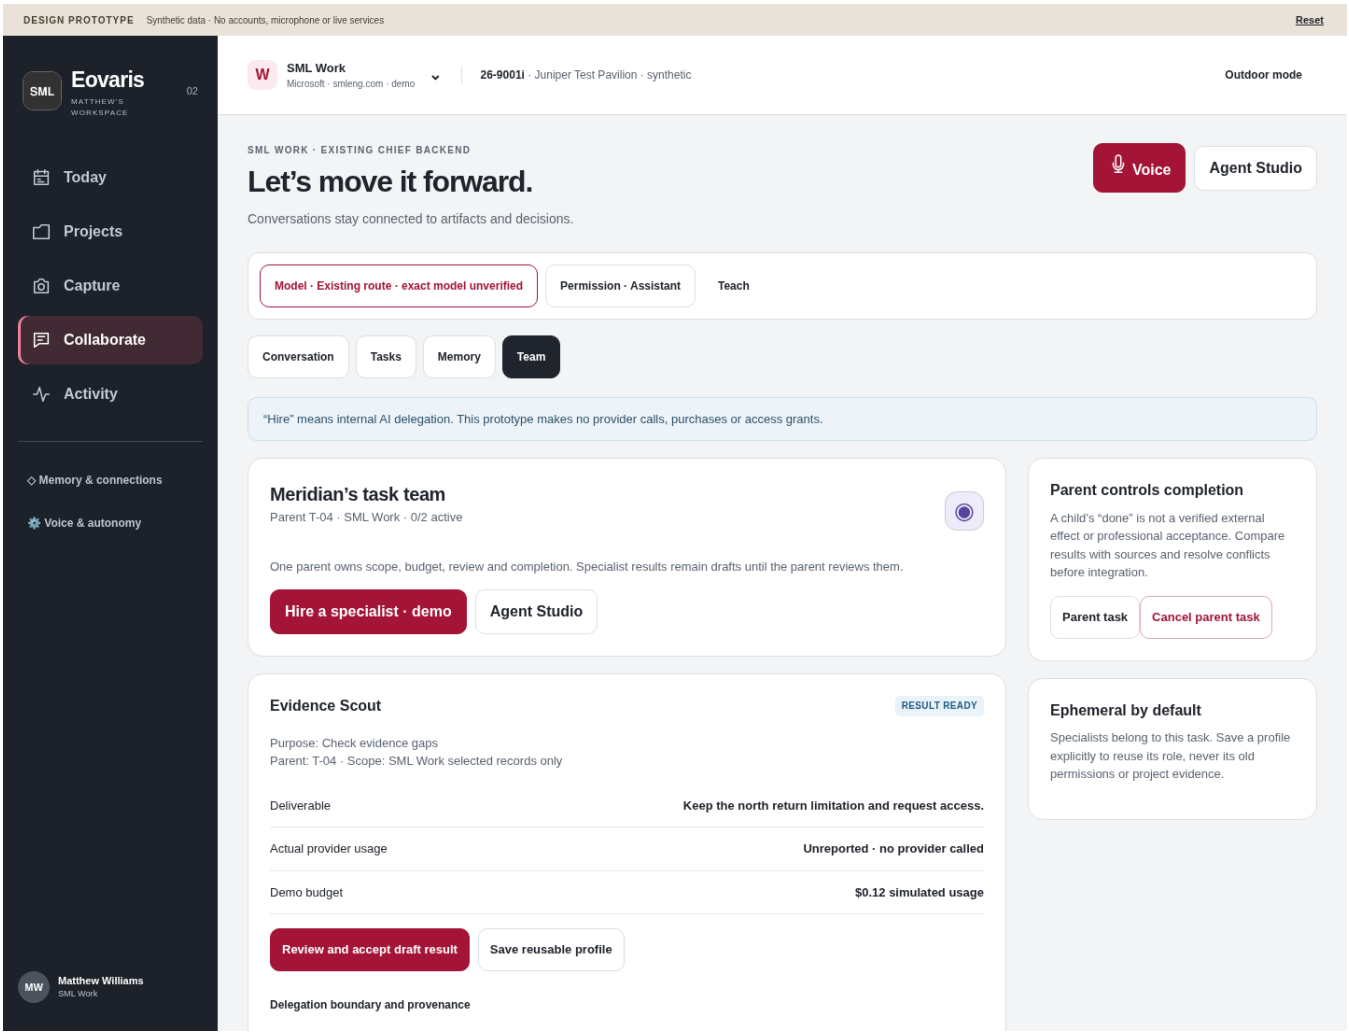

Voice separates Stop speaking, Change request and Cancel task. Media can stop while backend work continues. GPT-Live/custom voice building blocks are documented; account access and native audio behavior are unverified. All audio controls here are inert.

BOUNDED INTERNAL AI DELEGATION

Specialists deliver. The parent reviews.

“Hire” means delegate an internal AI task with a purpose, selected sources, narrower tools and a shared budget. Default: ephemeral specialists, depth one, no recursive spawning; explicitly save a role for reuse.

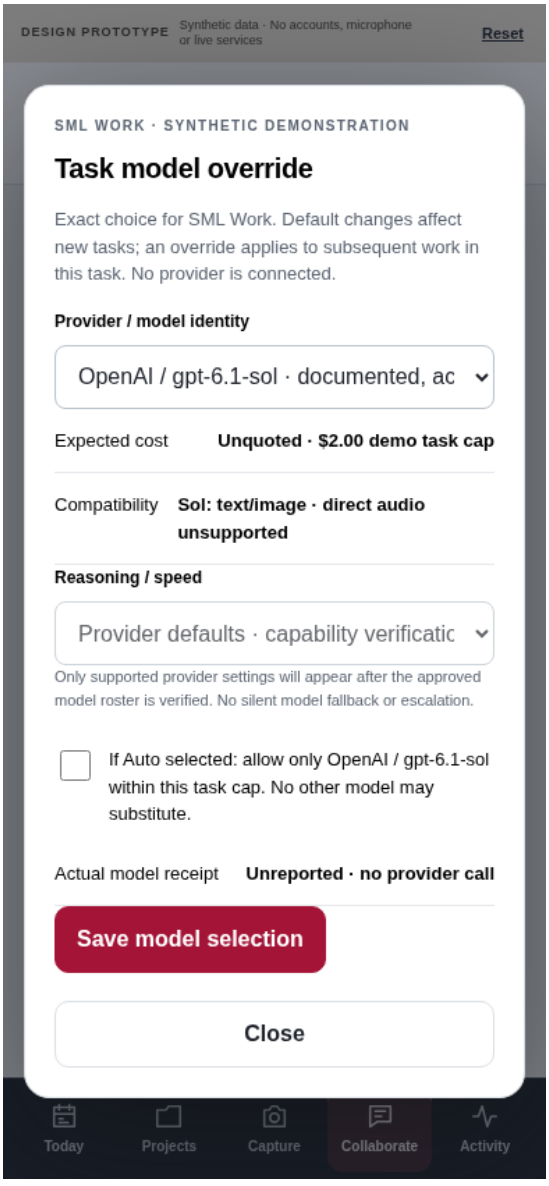

Team view exposes parent ownership, status, deliverable, provenance and unreported actual usage. Conflicts require source review. Cancellation propagates and fences later effects. Accepted child results are drafts, not external receipts or professional approval.

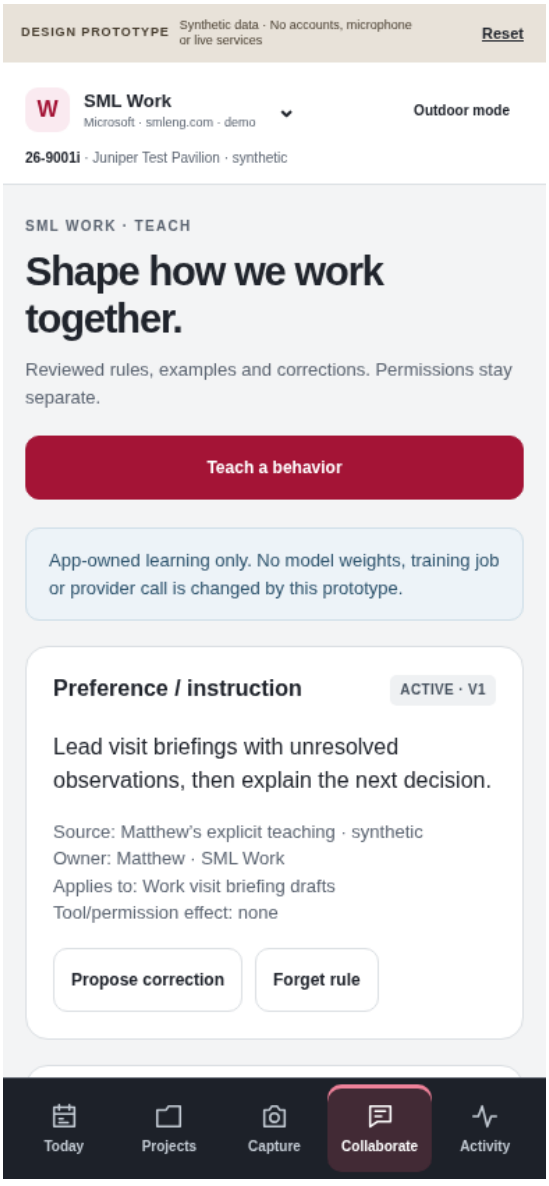

Demonstration budgets and sample usage are synthetic. No provider, subagent service or paid avatar generation was called.

MODEL CHOICE, PERMISSION AND TEACH

Your controls stay visible.

Choose an exact permitted default model per agent and an override per task. No silent fallback. Auto needs an explicit allowed-model set and budget; running changes checkpoint subsequent work. Actual model/usage remains unreported until a real receipt exists.

Assistant: permitted reads and internal drafts. Collaboration: live approval of exact effects. Proactive: full access to selected scope, with standing limits. Teach versions preferences/examples/templates/skills with review and rollback; it does not update model weights or grant permissions.

REUSE-FIRST ARCHITECTURE

Preserve access; resolve ownership.

Native Eovaris

Adaptive shell; separate context stores; original evidence; drafts/outbox; one navigation model.

Existing backend + Chief

Eovaris facade reuses compatible endpoints. Existing Chief owns task execution, scoped child runs, receipts and budgets.

Obsidian

Primary project/document knowledge. Memory and graph are sourced projections, not a replacement knowledge store.

Hub / PlanPilot

One writer per operational domain. Current ownership of plans/reports is unresolved; read-only adapters until an approved register exists.

Credentials

Keep provider keys server-side. Verify Eovaris bundle/team/App ID prefix/keychain groups; no assumed token movement across bundles or contexts.

Exact identity

Preserve raw job IDs and suffixes with app UUID/source mapping. Same-name jobs never auto-merge.

Optional adapters

DepthMeasure/TraceRivet evidence handoffs. Perplexity bounded cited research; no independent project authority.

Archived sign-in behavior does not establish current Outlook or business messaging access. Verify the live grants, app identity and keychain compatibility before changing any connection. No account configuration was inspected.

DELIVERY AND VALIDATION

A reviewable design, with clear gates.

Initial slice

One visit → original capture → before-leaving check → contractor package → report draft → separate reviews → resumable task. Context shell, basic memory explorer and Agent Studio included.

Next

Verified connector reuse, isolated Personal access, native push-to-talk, durable Chief execution and bounded specialists with actual receipts.

Later

Live voice customization, generated avatars, scalable graph, optional research and one human-approved requirements-to-evidence pilot.

Prior validation

Original design: 129 browser checks at 1440, 834, 390 and 320 pixels; no runtime errors or external requests. Ten selected text-token contrast pairs meet 4.5:1. No native Apple, production security, real audio or backend tests.

Evidence limits

Based on a portfolio review and selected sanitized source/icon. Original app archives were not inspected. Current production parity, account access and native behavior remain unverified.

Public release

Public-safe repackaging; internal delivery details omitted. No prototype scripts were executed for this release. No production app, connected accounts, live services or native build are included.

Decisions needed

Current app/backend identity; one writer per domain; retention/provider policy; actual grants; first inspection workflow and signer rules; persona/voice, autonomy and budget defaults.
